

LIQUID WASTE MANAGEMENT

Skip Hire's sewage bowzers with a capacity of 8000 litres suck up waste liquids, spillages and waste from sewers for safe disposal. It's a messy business but, somebody has to do it! If your soak-away or septic tank is full (or overflowing) do not hesitate to contact us. All staff members are vaccinated with the Hepatitis vaccine to prevent illness associated with dealing with this particular waste stream. Our drivers are also trained to provide an unblocking service at an additional fee.

GENERAL BENEFITS:

PROTECTS THE ENVIRONMENT

- Improper liquid waste management can be harmful to the atmosphere and result in a variety of emissions. When liquid waste contaminates a water source and changes its chemical composition, surface water pollution can occur. This can have serious consequences for human and animal drinking water.
- It's more hygienic.
- Since liquid waste pollution can make humans and animals very sick by contaminating water, soil, or the air, careful handling is essential to prevent disease spread and crop damage.
- It reduces Greenhouse gases.
- Liquid waste that has been improperly treated (for example, incineration when another approach would have been more appropriate) can produce fumes that contribute to greenhouse gas emissions. These gases cause heat to rise and are a nightmare for the atmosphere, leading to global warming and causing severe weather such as acid rain.

BUSINESS BENEFITS:

IT'S THE LAW

- Any business must have a system in place to safely store liquid waste once it has been produced, as well as plans to dispose of it when necessary. Many companies employ a professional waste management company, especially if they have a septic tank or cesspit that needs to be emptied on a regular basis.
